

* Conditional Statements

⇒ These are used to check the conditions in the to display the result.

Types

- IF • If else • If else if ladder / continuous if else • Nested if else

① IF

⇒ An 'if' statement executes a block of code only when the specified condition is satisfied.

Flowchart

Syntax

IF (condition):
statements

Ex. # Eligibility criteria to vote in india

```
age = int(input())
```

```
country = input()
```

```
pc = country.lower() # we convert input upper to lower
```

```
print(pc)
```

```
if (age >= 18 and pc == "india"):
```

```
    print("You are eligible to vote")
```

OP

SG

IndIa

india

You are eligible to vote

②

if else

⇒ It executes a block of code only when the given condition is true; otherwise it goes to else part and displays message.

• Flowchart

• Syntax

if (condition):

statements of if

else:

statements of else

Ex:

Write a program to check the given number is even or odd

Prgm

Num = int(input())

if (Number % 2 == 0):

```
print(f" {Numy} is Even Number")
```

```
else :
```

```
print(f" {Numy} is Odd Number")
```

<u>O/P</u>	89	34
	89 is Odd Number	34 is even Number

Ex1: Wap to calculate discount amount upto 5000 rs shopping 10% discount more than 5000 rs shopping 20% discount display the - exe payment amount &

Prgm

```
puts-amnt = float(input())
if (puts-amnt <= 5000):
    da = puts-amnt * 0.1
    pay-amount = puts-amnt - da
else:
    da = puts-amnt * 0.2
    pay-amount = puts-amnt - da
```

```
print(f" The Discount Amount is : {da} In
The Pay Amount is : {pay-amount} ")
```

<u>O/P</u>	6000
	The Discount Amount is : 600.0
	The pay Amount is : 3600.0

③ if else if ladder

⇒ It helps us check multiple conditions one by one. When a true condition is found, its block runs, and the rest are skipped.

• Flowchart

• 1st method

Syntax

if (condition 1) :

statements of condition 1

else if (condition 2) :

statements of condition 2

else:

if (condition 3):

statements of condition 3

else:

default statements

New Method

if (condition 1):

statements of condition 1

elif (condition 2):

statements of condition 2

elif (condition 3):

statements of condition 3

else:

Default statements

Ex: Write a program to check the given number is positive, negative or zero

Program

Num = int(input())

if (Num >= 0):

print(f"{Num} is positive")

elif (Num < 0):

print(f"{Num} is negative")

else:

print(f"{Num} is zero")

Old

-34

-34 is a negative

25

25 is a negative
